EXTERNAL EXAMINER

ABSTRACT

In today's fast-paced world, ensuring personal safety has become a major concern, especially for individuals traveling alone or in emergency situations. Guardian Angel is an Android-based mobile application designed to provide immediate assistance and enhance user safety through real-time alert mechanisms. The application is developed using Java in Android Studio and focuses on delivering quick emergency responses without complex dependencies.

The app includes essential features such as an SOS emergency button, live location tracking, and alert notifications to trusted contacts. Upon activation, the system automatically sends the user's current location and an emergency message to predefined contacts. The application uses GPS services for location tracking and integrates SMS and notification services for communication.

Guardian Angel is designed with a simple and intuitive user interface to ensure ease of use during critical situations. The system demonstrates how mobile technology can be effectively utilized to provide security, rapid response, and peace of mind. This application acts as a digital safety companion, ensuring users are never alone in times of need.

ACKNOWLEDGEMENT

Initially, we thank the Almighty for being with us through every walk of our life and showering his blessings through the endeavour to put forth this report. Our sincere thanks to our chairman **Mr. S. MEGANATHAN, B.E, F.I.E.**, our respected Chairperson **Dr. (Mrs.) THANGAM MEGANATHAN, Ph.D.**, our Vice Chairman **Mr. ABHAY SHANKAR MEGANATHAN, B.E, M.S.**, for providing us with the requisite infrastructure and sincere endeavouring in educating us in their premier institution.

Our sincere thanks to **Dr. S.N. MURUGESAN, M.E., Ph.D.**, our beloved principal for his kind support and facilities provided to complete our work in time. We express our sincere thanks to **Dr. E.M MALATHY, M.E., Ph.D.**, Professor and Head of the Department of Computer Science and Engineering and our mentor **Mrs B.Deepa M.E., (Phd).**, Department of Computer Science and Engineering for his useful tips during our review to build our project.

CHAPTER 1

INTRODUCTION

1.1 GENERAL

Guardian Angel is a mobile safety application developed to provide users with immediate and reliable assistance during emergency situations. The application is specifically designed to enhance personal safety by enabling fast communication with trusted contacts whenever a user feels unsafe, threatened, or encounters a dangerous situation. It serves as a smart emergency support system that helps individuals respond quickly during critical moments.

The application is built using Android technology, making it easily accessible to a large number of smartphone users. It integrates several important safety features such as SOS alert activation, GPS-based real-time location tracking, emergency notifications, and instant communication with pre-registered emergency contacts. When the user triggers the SOS feature, the application automatically sends alert messages along with the user's live location to selected family members, friends, or guardians, ensuring that help can reach them as quickly as possible.

One of the major objectives of Guardian Angel is to reduce response time during emergencies by automating the alert process. In many dangerous situations, users may not have enough time to manually call for help. To solve this issue, the application allows alerts to be triggered with minimal effort, such as through a single tap, button press, or quick interaction. This ensures that users can seek assistance even under stressful conditions.

The user interface of the application is designed to be simple, user-friendly, and highly accessible, allowing people of all age groups to use it without difficulty. Special attention is given to creating a clean interface where emergency features can be accessed instantly without navigating through multiple screens.

Additionally, the application focuses on reliability, efficiency, and real-time performance, ensuring that alerts are delivered quickly even in critical situations. Guardian Angel can be especially useful for women's safety, elderly care, children's protection, travelers, and individuals who may require emergency assistance while alone.

Overall, Guardian Angel acts as a digital safety companion that leverages mobile technology to improve personal security, provide peace of mind, and ensure faster emergency response when it matters the most.

1.2 SCOPE OF THE WORK

Here's a slightly expanded but shorter version (more concise than the previous one):

The scope of this project includes the design and development of a mobile safety application that improves personal security through real-time emergency support features. The application is designed to help users during unsafe or emergency situations by providing quick access to assistance and reducing response time.

The system includes key features such as SOS alert generation, real-time GPS location tracking, and instant notifications to trusted contacts. When an emergency alert is triggered, the application automatically shares the user's current location with registered contacts, allowing them to respond quickly and provide help.

The project also focuses on creating a simple and user-friendly interface that can be easily used during stressful situations. Users can access emergency features with minimal interaction, making the application practical and efficient.

Additionally, the application is developed to run smoothly on standard Android devices without requiring expensive hardware or complex infrastructure. This ensures accessibility, reliability, and convenience for everyday personal safety needs.

1.3 AIM AND OBJECTIVES OF THE PROJECT

The primary aim of this project is to design and develop a mobile application named Guardian Angel, which enhances personal safety by providing instant emergency assistance through real-time alert systems and location tracking. The application is intended to act as a digital safety companion that enables users to quickly communicate with trusted contacts during critical situations. By utilizing mobile technologies such as GPS and messaging services, the system ensures rapid response and improved security for users. The objectives of this project include developing an efficient SOS emergency system that allows users to send alerts instantly with a single action, implementing real-time location tracking using GPS technology to accurately share the user's current location, and designing an alert notification system that sends emergency messages to predefined trusted contacts through SMS or application notifications. The project also focuses on creating a contact management module to securely store and manage emergency contacts, ensuring a simple and user-friendly interface so that users can operate the application easily during stressful situations, and providing a reliable and fast response mechanism that functions effectively in critical conditions. Furthermore, the system aims to utilize mobile technology in an efficient manner to improve personal safety, reduce response time during

emergencies, and offer a dependable solution for individuals in need of immediate assistance. In addition, the application is designed to ensure high reliability and continuous availability so that users can depend on it at all times. The system also focuses on minimizing user interaction during emergencies by enabling quick and direct access to critical features. Security and privacy of user data are considered important, ensuring that personal information and location details are handled safely. The application is developed with scalability in mind, allowing future enhancements and integration of advanced features. Overall, the project aims to provide a practical, efficient, and user-centric solution for enhancing personal safety in real-world situations.

CHAPTER 2

2.1 LITERATURE SURVEY

Recent advancements in mobile technology have led to the development of various personal safety applications that aim to provide assistance during emergency situations. These applications are designed to improve user safety by enabling quick communication with family members, friends, or emergency services when a person feels unsafe or faces danger. With the increasing use of smartphones, mobile-based safety solutions have become more practical and accessible for everyday use.

Many existing safety applications use GPS technology to track the user's real-time location and share it with trusted contacts during emergencies. This feature helps emergency contacts identify the exact location of the user and respond quickly. Studies and existing systems show that real-time location sharing plays a major role in improving emergency response and reducing delays in providing assistance.

Another commonly used feature in modern safety applications is the one-touch SOS alert system. This feature allows users to send emergency alerts instantly without going through multiple screens or complicated steps. Research indicates that reducing user interaction during emergencies significantly improves response time and increases the chances of receiving help quickly.

Several applications also use SMS alerts and notification systems to ensure that emergency messages are delivered effectively. SMS-based alerts are particularly useful in situations where internet connectivity is weak or unavailable, making the system more dependable in remote or low-network areas.

Existing personal safety applications focus heavily on providing a simple and user-friendly interface, as users in stressful situations require quick and easy access to emergency features. Research highlights that applications with minimal design, clear navigation, and faster access to safety tools perform better during critical situations.

However, many currently available applications face limitations such as dependency on stable internet connections, complex backend systems, delayed notifications, and complicated user interfaces. These issues can reduce the reliability of the system during emergencies.

The Guardian Angel application is developed by analyzing these existing systems and addressing their limitations. It integrates essential features such as SOS alerts, real-time GPS tracking, and emergency notifications in a simple, efficient, and reliable manner. The application focuses on faster response time, ease of use, and reduced dependency on external systems.

CHAPTER 3

SYSTEM DESIGN

3.1 ARCHITECTURE DIAGRAM

Fig 3.1.1 – Architecture Diagram

The Productivity Pocket App Architecture (refer Fig. 3.1.1) follows a modular, lightweight design optimized for offline use and efficient user interaction. Each core feature—Task Manager, Voice-to-Text Notes, Alarm Scheduler, Daily Journal, Text-to-Speech Reader, Focus Timer, and Sticky Notes—is built as an independent module using Kotlin. Data flow across

modules is managed via SharedPreferences and local JSON files, ensuring fast access and persistent storage without the need for a database.

The system integrates Android's native services (SpeechRecognizer, AlarmManager, TextToSpeech) with minimal dependencies, keeping the app responsive and energy-efficient. Modular UI components allow smooth navigation and feature isolation.

3.2 USE CASE DIAGRAM

Fig 3.2.1 – Use Case Diagram

productivity by helping users stay focused, and the Sticky Notes feature enables quick note-taking. These functions work together seamlessly to offer a comprehensive, adaptive tool for managing tasks and notes efficiently.

3.3 HARDWARE SPECIFICATIONS

The Productivity Pocket mobile application is designed to operate efficiently on standard smartphones and computing devices without requiring any specialized or high-end hardware components. The application is developed with an optimized architecture that ensures smooth performance of its major functionalities, including task management, voice-to-text conversion, alarm scheduling, focus timers, sticky notes, reminders, and productivity tracking features. The system is intended to be lightweight and accessible so that users can easily install and use it on commonly available devices. To ensure optimal performance, the application requires a quad-core processor, such as Qualcomm Snapdragon 660 or higher or MediaTek Helio P60 or higher. These processors provide sufficient computing power to handle multiple operations simultaneously, such as running timers, processing reminders, and managing voice input features without lag. The recommended RAM requirement is a minimum of 3 GB, while 4 GB RAM or higher is preferred for smoother multitasking performance. Higher RAM capacity allows users to switch between features like task management, note-taking, and alarm scheduling seamlessly without affecting app performance.

For storage, the application requires at least 32 GB of internal storage or higher to store application files, user-generated notes, task records, reminder data, and synchronization files. Additional storage ensures that users can maintain long-term productivity records without running into storage limitations. The app does not require a dedicated graphics card, as integrated graphics support is sufficient for handling the user interface, animations, and general visual components of the application. This makes the system compatible with a wide range of smartphones and budget-friendly devices.

Additional requirements include a stable internet connection for cloud synchronization, backup services, and real-time data storage. A touchscreen interface is necessary for smooth user interaction, and optional hardware components such as a microphone can enhance voice assistant and voice-to-text functionalities. These hardware and system requirements ensure that the Productivity Pocket application runs smoothly and efficiently across various devices while delivering a seamless user experience for task organization, note-taking, time management, and overall productivity improvement.

3.4 SOFTWARE SPECIFICATIONS

The **Productivity Pocket** mobile app is designed using a modular software architecture to ensure smooth operation across various devices. The app integrates features like task management, voice-to-text notes, alarm scheduling, focus timers, and sticky notes. The software stack is composed of the following technologies:

1. Frontend Framework:

Kotlin/Jetpack Compose (for the user interface and seamless experience across Android devices)

2. Styling Tools:

Material Design (for clean and modern UI design)

3. Backend Framework:

Firebase (for cloud data synchronization, user authentication, and real-time updates)

4. Machine Learning Libraries:

TensorFlow Lite (for integrating any ML models for task predictions or voice-to-text enhancements)

5. Database:

Shared Preferences and local JSON (for local data storage and quick access to user-specific data like tasks, notes, and settings)

6. Data Handling & Preprocessing:

Kotlin's standard library for efficient data handling and processing.

CHAPTER 4

PROPOSED SYSTEM

The Proposed System for the Productivity Pocket app is designed to integrate multiple productivity tools into one seamless platform, providing users with efficient ways to manage their tasks, notes, and schedules. The system focuses on user-centric features such as task management, voice-to-text notes, alarm scheduling, a focus timer, and quick sticky notes.

Key components of the proposed system include:

Manager: Allows users to create, manage, and track tasks with reminders and due dates.

Task Voice-to-Text Notes: Enables users to dictate notes that are converted into text for easy access and editing.

Alarm Scheduler: Notifies users at predefined times to help them manage tasks effectively.

Focus Timer: A timer to improve focus and productivity, using the Pomodoro technique to break work into intervals.

Sticky Notes: Provides a digital space to jot down quick thoughts and ideas, enabling users to stay organized.

The system integrates these modules into a cohesive experience, ensuring that all user data is stored securely and can be accessed quickly using Shared Preferences and local JSON for data management. Additionally, the Firebase backend provides synchronization and cloud storage for tasks, notes, and user settings, allowing seamless access across devices. The user interface is built using Jetpack Compose for Android, ensuring responsiveness and a user-friendly experience.

CHAPTER 5

MODULE DESCRIPTION

The **Productivity Pocket** app is designed with several modules to improve productivity through efficient task management, note-taking, time management, and other personalized features. Below is an overview of each module:

1. Task Manager Module

The Task Manager allows users to create, manage, and organize their tasks efficiently. Features include task creation with titles, descriptions, deadlines, priority levels, and notifications. Tasks can be marked as complete, and users can filter tasks based on due dates or priority. The module also provides visual reminders for approaching deadlines. Data is stored locally using SharedPreferences or local JSON for quick retrieval.

2. Voice-to-Text Notes Module

This module allows users to dictate their notes using voice commands, which are then converted into text for easy editing and storage. It supports offline voice-to-text functionality, ensuring that users can take notes anytime. The system stores voice-to-text transcriptions locally, offering fast access when the user wants to review or modify the notes. The integration with Jetpack Compose provides a seamless user experience.

3. Alarm Scheduler Module

The Alarm Scheduler module helps users set alarms for reminders or scheduled tasks. Users can set recurring or one-time alarms with customized tones and labels. The system alerts the user based on the set schedule, offering timely reminders for tasks and activities. The alarms are integrated with the system notifications for easy access and control.

4. Focus Timer Module

This module employs the Pomodoro Technique, allowing users to focus on tasks in intervals (typically 25 minutes) followed by short breaks.

5. Sticky Notes Module

The Sticky Notes module provides users with a simple and efficient way to jot down quick ideas or reminders. Notes can be created, edited, and deleted. This module serves as a digital version of sticky notes, ensuring that important reminders or thoughts are always accessible. Users can easily navigate between their sticky notes and other modules within the app.

KEY BENEFITS OF PROPOSED SYSTEM

Enhanced Task Management:

The app offers an efficient, organized way to manage tasks, improving productivity by allowing users to create, track, and prioritize tasks effectively.

Voice-to-Text Integration:

With the voice-to-text feature, users can quickly take notes or manage tasks hands-free, increasing convenience and accessibility, especially for multitasking.

Customizable Alerts and Reminders:

The alarm scheduler and focus timer ensure timely reminders for tasks, while the customizable focus timer helps users manage their time effectively, leading to better work-life balance.

Easy-to-Use Sticky Notes:

The Sticky Notes (Quick Notes) feature provides a fast, no-fuss way for users to jot down thoughts, ideas, and reminders on the go, improving memory retention and task execution.

CHAPTER 7

CONCLUSION AND FUTURE ENHANCEMENTS

The "Productivity Pocket" app provides users with an all-in-one solution for managing tasks, setting reminders, staying focused, and organizing daily activities. With features like voice-to-text notes, task management, alarm scheduling, sticky notes, and a focus timer, the app aims to improve productivity by integrating essential tools in a user-friendly interface. The app's flexibility, offering both cloud synchronization through Firebase and offline functionality, ensures users can stay productive anytime, anywhere.

Future Enhancements:

- 1. User Personalization:** Integrating more customizable themes, notification settings, and personalized recommendations for tasks based on usage patterns.
- 2. Cross-Platform Support:** Expanding the app's reach to multiple platforms (iOS, web) to offer a seamless experience across devices.
- 3. Integration with Other Tools:** Allowing integration with other productivity tools and calendars like Google Calendar or Microsoft To-Do.
- 4. AI-Based Task Suggestions:** Implementing AI-driven suggestions task prioritization based on past behavior and time management.
